DOOR HEADER DETAIL – 90mm TRACK (NO GATE).

1. The best solution for aesthetics and soundproofing is to build the door header around the track and have a taller than standard door. See below. It is strongly advised the track is installed is prior to the horizontal door header. It may be necessary to lower the track (due to obstacles below the ceiling, please consult your OpeMed manager if queries).

2. If taller doors are not possible, then a rectangular cutout can be made from bottom of finished ceiling to top of door header (including frame) of 300mm wide for OT200 and 150mm wide for the Portable Ceiling Hoist.
